"Axalta is excited to bring another innovative product to its internal pipe coating line," said

Meghan Hodge, Axalta Global Product Marketing Manager, Functional Coatings. "Nap-Gard 7-0016 is a good option for customers who need corrosion protection in severe downhole environments."

The environments explored by oil and gas operators today have higher temperatures and concentrations of hydrogen sulfide (H₂S), carbon dioxide (CO₂), and other gas contaminants. These conditions require the use of costly metal chrome alloys to avoid pipeline corrosion and failure. Axalta's new generation of high-temperature coatings offer a low cost alternative to protect the internal diameter of the world's pipelines.

Axalta's Nap-Gard collection of powder coatings are used on external and internal oil, gas and water pipelines with single, dual, and multi-layer application options. Nap-Gard also provides corrosion protection solutions that can be used to coat valves, fittings and rebar. Axalta's functional coatings offer innovative solutions for today's epoxy-based coating applications and are designed to provide superior corrosion protection for products that are used in the most demanding environments.
