

## Memorial Sloan Kettering Cancer Center and Quest Diagnostics Partner to Advance Precision Medicine in Cancer Diagnosis and Treatment

June 1, 2014

### Diagnostic insights into gene mutations in solid tumor cancers will aid therapy selection and prognosis for patients and advance research

NEW YORK and MADISON, N.J., June 1, 2014 /PRNewswire/ -- Memorial Sloan Kettering Cancer Center, the world's oldest and largest private cancer center, and Quest Diagnostics (NYSE: DGX), the world's leading provider of diagnostic information services, today announced a joint collaboration that will utilize MSK's clinical and research insights into gene mutations associated with solid tumors. The goal is to use molecular laboratory testing to improve physicians' ability to treat patients with breast, prostate, colon, lung, and a variety of other solid tumor cancers by giving them a better understanding of the genomic underpinnings of their patients' illnesses.

In recent years, research has demonstrated that certain gene mutations influence the efficacy of cancer drug therapies, and that a therapy that is effective for one type of cancer may be effective for other types that share the same gene mutations. MSK has amassed extensive databases of gene mutations linked to various types of cancer and developed pharmaceutical treatments based on scientific literature, treatment of patients by the institution's multidisciplinary teams, and clinical trials conducted by MSK researchers and scientists.

In the first phase of the collaboration, MSK will provide contextual information about individual mutations identified as part of Quest's OncoVantage™, an independently validated, lab-developed test that launches today to enable molecular characterization of solid tumors. Beginning this summer, physicians who order OncoVantage will benefit from the MSK data through a co-branded clinical annotation report designed to aid the assessment of a patient's prognosis, as well as to guide treatment selection and to monitor disease progression.

Over time, the two organizations intend to further study and extend the mutation data sets to potentially generate improved diagnostics, in addition to research and clinical trials.

"This relationship will empower clinicians to improve their patients' health by identifying the best therapies for patients today and by identifying specific patients who may benefit from participation in clinical trials. The needs of tomorrow's patients will be addressed by the deeper knowledge base we are building and its potential to drive the basic science needed to discover new therapies," said Craig B. Thompson, MD, MSK's President and CEO. "This collaboration with Quest speaks to our mission and extends our ability to improve the quality of care for patients everywhere."

"We are excited to offer oncologists and patients everywhere unprecedented access to Memorial Sloan Kettering Cancer Center's exceptional knowledge of the role of gene mutations in solid tumors and the therapies most effective in treating them," said Steve H. Rusckowski, President and CEO of Quest Diagnostics. "By combining our broad market reach, which covers half the practicing physicians and hospitals in the United States, with MSK's deep experience in cancer care and molecular science, we hope to illuminate the best possible cancer treatment options for patients across the country."

#### Extending Molecular Laboratory Testing of Solid Tumors across the United States

Quest's OncoVantage test is performed on tumor biopsies and uses next-generation sequencing technology to assess the most commonly mutated exons in 34 genes. The sequencing data, in de-identified form, will be shared with MSK, which will leverage its databases to correlate specific gene mutations to potential therapies and disease progression applicable to that cancer type.

The second phase of the collaboration between Quest and MSK will involve development of a more far-reaching test by Quest involving potentially hundreds of genes. The expanded test is expected to launch by the spring of 2015.

MSK has amassed extensive experience in this area over the past decade and has recently developed a pioneering test — called MSK-IMPACT™, or Integrated Mutation Profiling of Actionable Cancer Targets — that can reliably and accurately screen for mutations in more than 340 genes. Tumors from MSK patients studied thus far have had on average between two and 10 potentially actionable mutations.

In addition, MSK's clinical annotation process will be enhanced by *de-identified* gene data from Quest's OncoVantage test. The data will be used to extend the range of information used to assess the clinical significance of gene alterations and potential correlations with therapeutic response. This real-time data exchange will enable rapid translation of discoveries into clinically actionable information for managing cancer patients. The two organizations also intend to jointly study, evaluate, and augment the size and scope of the mutation data sets, which have the potential to become more important in scientific research and publication.

"Quest has demonstrated a commitment to evidence-based use of next-generation sequencing data in cancer," added Jose Baselga MD, MSK's Physician-in-Chief. "This commitment to advancing molecular diagnostics in both a clinical and research context is central to our selection of Quest as a partner."

"MSK is widely recognized for its groundbreaking contributions to cancer care, treatment, and research," said Jon R. Cohen, MD, Senior Vice President and Chief Medical Officer of Quest Diagnostics. "This collaboration is important because it is a way to extend this tremendous cancer expertise, in the form of Quest's OncoVantage, beyond patients treated at MSK's center, but potentially to any patient, anywhere in the United States, for whom solid-tumor molecular profiling could illuminate efficacious treatment."

Quest Diagnostics has developed several next-generation sequencing lab-developed tests that it offers nationally in areas ranging from HIV to BRCA (Breast/Ovarian) and Lynch syndrome inherited cancers.

Financial terms were not disclosed.

#### **About Memorial Sloan Kettering Cancer Center**

We are the world's oldest and largest private cancer center, home to more than 12,000 physicians, scientists, nurses, and staff united by a relentless dedication to conquering cancer. As an independent institution, we combine 130 years of research and clinical leadership with the freedom to provide highly individualized, exceptional care to each patient. And our always-evolving educational programs continue to train new leaders in the field, here and around the world. For more information, go to [www.mskcc.org](http://www.mskcc.org).

#### **About Quest Diagnostics**

Quest Diagnostics is the world's leading provider of diagnostic information services that patients and doctors need to make better healthcare decisions. The company offers the broadest access to diagnostic information services through its network of laboratories and patient service centers, and provides interpretive consultation through its extensive medical and scientific staff. Quest Diagnostics is a pioneer in developing innovative diagnostic tests and advanced healthcare information technology solutions that help improve patient care. Additional information is available at [QuestDiagnostics.com](http://QuestDiagnostics.com). Follow us at [Facebook.com/QuestDiagnostics](https://Facebook.com/QuestDiagnostics) and [Twitter.com/QuestDX](https://Twitter.com/QuestDX).
